

Employee Management System

The **Employee Management System** is a console-based Java application developed to manage employee information efficiently. The project uses **Object-Oriented Programming (OOP)** concepts such as classes, objects, constructors, encapsulation of employee data, and an **ArrayList** for storing multiple employee records.

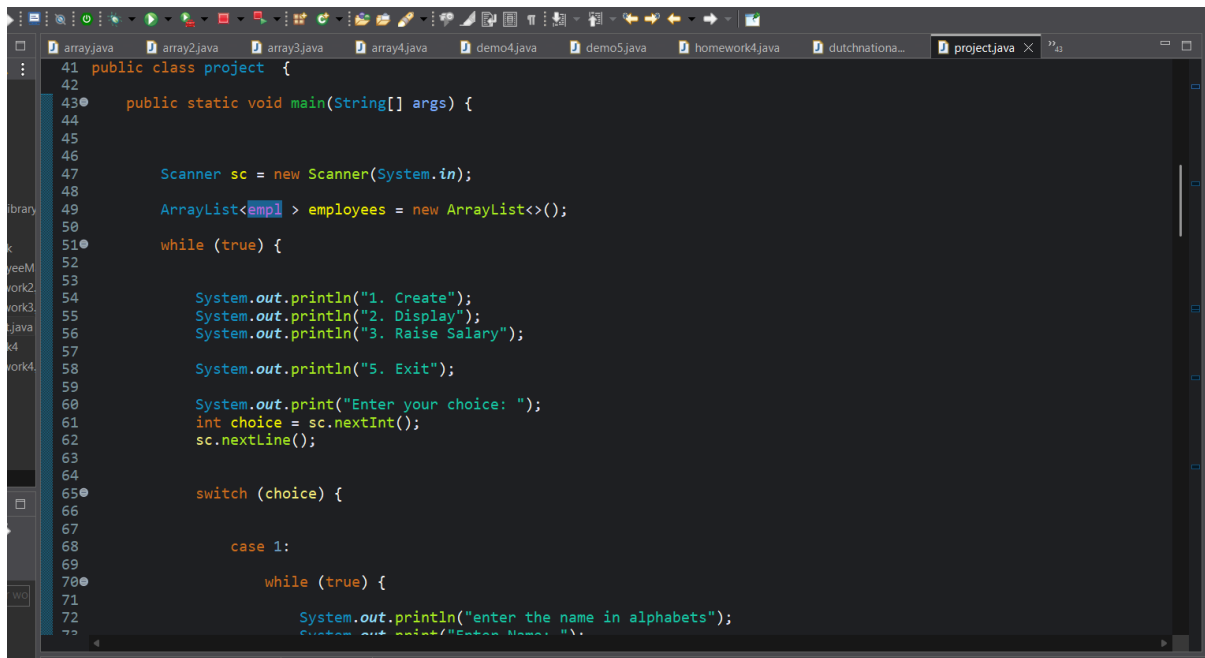

The system provides a menu-driven interface through which users can **create employees, display employee details, and raise an employee's salary**

The main objective of this project is to develop a simple and user-friendly employee management application while demonstrating the practical implementation of **Java OOP concepts and collection handling**. It helps users maintain employee records and perform basic salary management operations through a console-based interface.

```
174         boolean found = false;
175
176         for (Employee emp : employees) {
177             if (emp.name.equalsIgnoreCase(searchName)) {
178                 found = true;
179
180                 double oldSalary = emp.salary;
181
182                 double raise =
183                     emp.salary * percentage / 100;
184
185                 emp.salary =
186                     emp.salary + raise;
187
188                 System.out.println(
189                     "\nSuccess!"
190                 );
191
192                 System.out.println(
193                     "Employee Name : " + emp.name
194                 );
195
196                 System.out.println(
197                     "Old Salary : " + oldSalary
198                 );
199
200                 System.out.println(
201                     "Raise : " + percentage + "%"
202                 );
203
204                 System.out.println(
205                     "New Salary : " + emp.salary
206                 );
207
208                 break;
209             }
210         }
211
212         if (!found) {
213             System.out.println(
214                 "boss enter the correct name."
215             );
216         }
217     }
218 }
```

The **Employee Management System** is a Java-based console application used to manage employee details. It allows users to **create employees, display their information, and increase salaries** based on a given percentage. The project uses **OOP concepts, ArrayList, Scanner, loops, and switch-case** to manage employee records efficiently.

A screenshot of an IDE window showing a Java file named 'project.java'. The code defines a public class 'project' with a 'main' method. Inside 'main', a 'Scanner' object 'sc' is created from 'System.in'. An 'ArrayList' named 'employees' is initialized. A 'while (true)' loop contains a menu with five options: '1. Create', '2. Display', '3. Raise Salary', '5. Exit', and a prompt to 'Enter your choice: '. The user's choice is read as an integer. A 'switch' statement handles the choice, with 'case 1:' containing another 'while (true)' loop that prompts the user to 'enter the name in alphabets: ' and then prints the name. The code is partially visible, showing lines 41 through 72.

```
41 public class project {
42
43     public static void main(String[] args) {
44
45
46
47         Scanner sc = new Scanner(System.in);
48
49         ArrayList<emp> employees = new ArrayList<>();
50
51         while (true) {
52
53
54             System.out.println("1. Create");
55             System.out.println("2. Display");
56             System.out.println("3. Raise Salary");
57
58             System.out.println("5. Exit");
59
60             System.out.print("Enter your choice: ");
61             int choice = sc.nextInt();
62             sc.nextLine();
63
64
65             switch (choice) {
66
67                 case 1:
68
69                     while (true) {
70
71                         System.out.println("enter the name in alphabets");
72                         System.out.print("Enter Name: ");
```

Key Features

1. Create Employee

- Allows the user to enter an employee's name and age.
- Provides designation options such as:
 - Programmer – ₹20,000
 - Tester – ₹15,000
 - Manager – ₹25,000
- The salary is automatically assigned based on the selected designation.
- Multiple employees can be added.

2. Display Employee Details

- Displays the name, age, designation, and salary of all employees.
- Shows a message if no employees have been created.

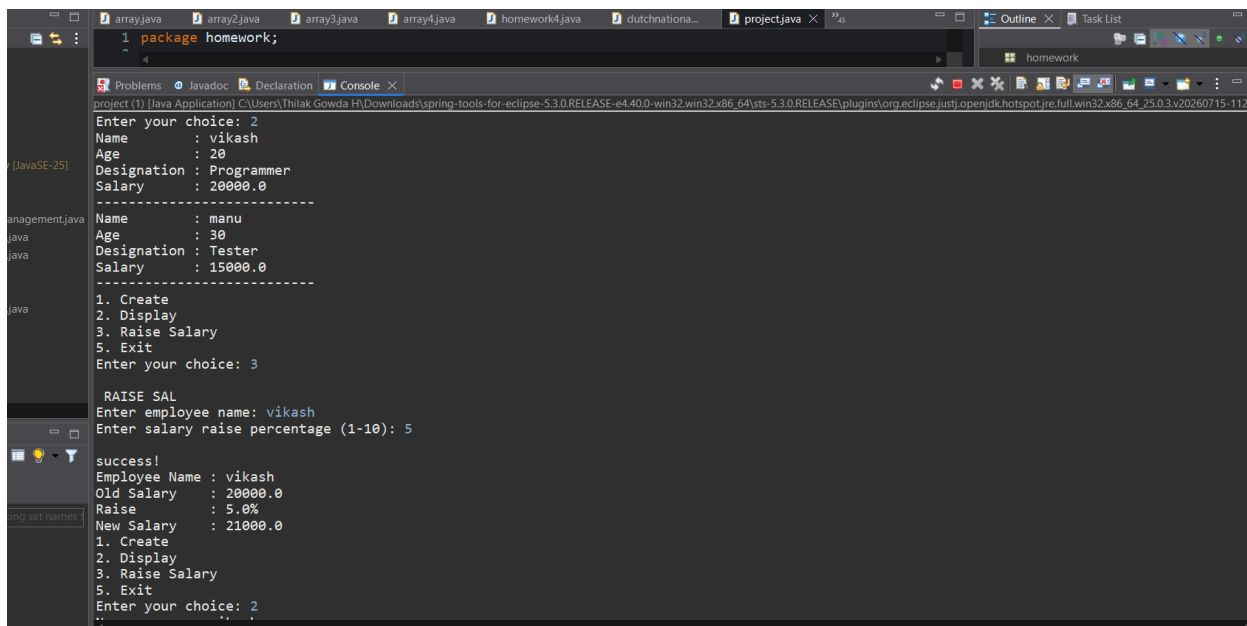

3. Raise Salary

- Searches for an employee using their name.
- Allows the user to enter a salary increment percentage between 1% and 10%.
- Calculates and displays the old salary, raise percentage, and updated salary.

4. Exit

- Allows the user to safely exit the application and closes the Scanner.

Result/output

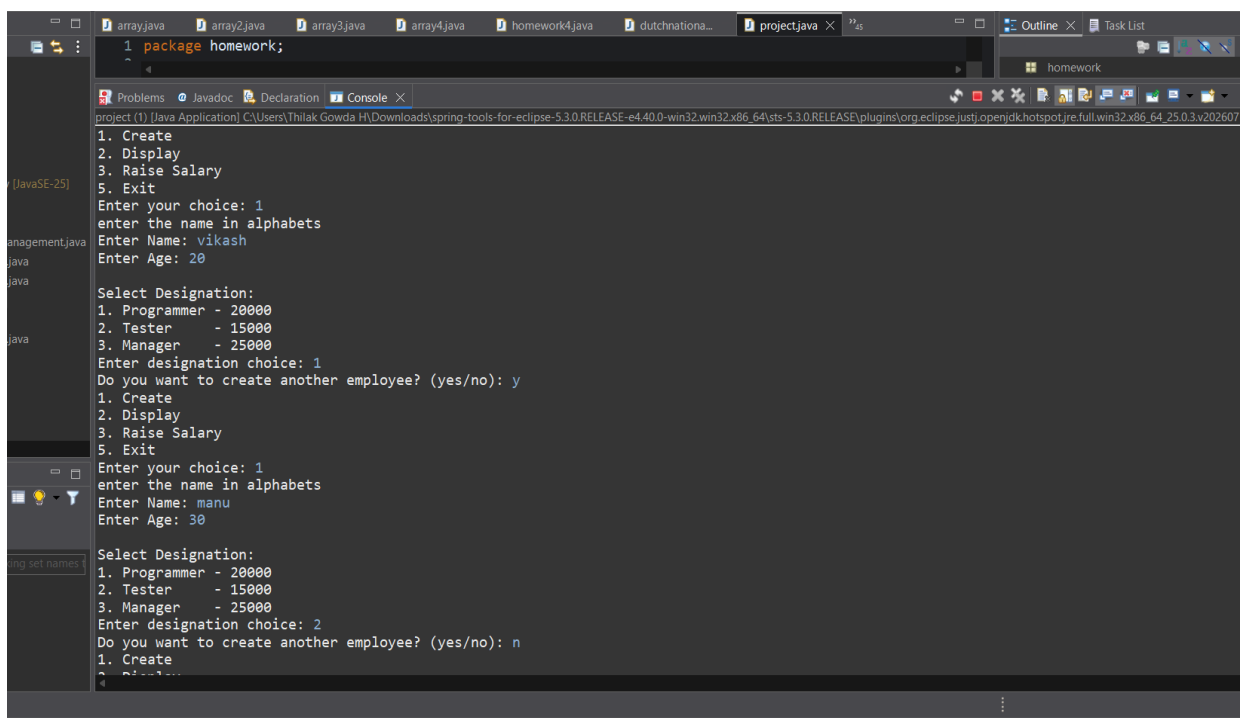

```
1 package homework;

project (1) [Java Application] C:\Users\Thilak Gowda H\Downloads\spring-tools-for-eclipse-5.3.0.RELEASE-e4.40.0-win32.win32.x86_64\sts-5.3.0.RELEASE\plugins\org.eclipse.justi.openjdk.hotspot.jre.full.win32.x86_64_25.0.3.v20260715-112

Enter your choice: 2
Name      : vikash
Age       : 20
Designation : Programmer
Salary    : 20000.0
-----
Name      : manu
Age       : 30
Designation : Tester
Salary    : 15000.0
-----
1. Create
2. Display
3. Raise Salary
5. Exit
Enter your choice: 3

RAISE SAL
Enter employee name: vikash
Enter salary raise percentage (1-10): 5

success!
Employee Name : vikash
Old Salary    : 20000.0
Raise         : 5.0%
New Salary    : 21000.0
1. Create
2. Display
3. Raise Salary
5. Exit
Enter your choice: 2
```

3. Manager - 25000
Enter designation choice: 2
Do you want to create another employee? (yes/no): n
1. Create
2. Display
3. Raise Salary
5. Exit
```

Conclusion

The Employee Management System provides a simple solution for managing basic employee information. It demonstrates how Java can be used to create menu-driven applications that store, retrieve, and modify data dynamically. The project can be further enhanced by adding features such as **employee ID**, **employee deletion**, **searching**, **salary reports**, **data validation**, and **database connectivity**.
